AB - KR2001057495/ NOVELTY - A polyamide resin composition is provided for improving crystallization rate, transparency and elongation rate when manufacturing film product by adding montmorillonite compound to the resin composition.

- DETAILED DESCRIPTION - The polyamide resin composition having excellent crystallization rate, transparency and elongation rate comprises 100 weight parts of copolymer consisting of 70-99 wt.% of epsilon-caprolactam and 30-1 wt.% of a combination of meta-xylene diamine and adipic acid with the addition of 0.5-5.0 weight parts of montmorillonite compound. The resin composition is prepared by adding weight a mixture of epsilon-caprolactam and water to result 300 to 1,000 weight parts of total amount based on 100 weight parts of montmorillonite and heating the resultant mixture at 70-140 deg.C.
